                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method of identifying compounds which are capable of modifying the activity of a signal transduction pathway which is dependent upon a G-protein coupled receptor. These compounds may include the novel G-proteins 6q14myr (shown here), 6q15myr, 6q14, 6qs5
                                                                                                                                                                                                                                                                                                                               30-OCT-2000; 2000US-243770P
                                                                                                                                                                                                                                                                                                                                                                                      24-OCT-2001; 2001WO-US32619.
                                                                                                                                                                                                                                                                                                                                                                                                                                            10-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO200236622-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated variant of a G_q protein, which exhibits increased promisculty relative to the corresponding G_q protein. The variant is used to identify a compound that modulates sensory signaling in sensory cells and to identify a compound that interacts with the G_q variant protein. The G_q protein variant is useful for analysing and discovering agonists or antagonists of chemoreceptors, such as G protein coupled receptors involved in sensing of tastants, as G protein coupled receptors involved in sensing of tastants, although a protein acid sequence of a G protein alpha sub-unit q family (G alpha q) protein that can functionally couple to sensory cell receptors such as taste GPCR's (G protein-coupled receptors) and olfactory GPCR's in an overly promiscuous manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Fig

The variant is used to identify a compound that modulates sensory signaling in sensory cells and to identify a compound that interacts with the G_q variant protein. The G_q protein variant is useful for analysing and discovering agonists or antagonists of chemoreceptors, such as G protein coupled receptors involved in sensing of tastants, olfactants or pheromones. This is the amino acid sequence of a G protein alpha sub-unit q family (G alpha q) protein that can functionally couple to sensory cell receptors such as taste GPCR's (G protein-coupled receptors) and olfactory GPCR's in an overly promiscuous manner.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exhibits increased promisculty relative to the corresponding G_q protein. The variant is used to identify a compound that modulates sensory signaling in sensory cells and to identify a compound that interacts with the G_q variant protein The G_q protein variant is useful for analysing and discovering agonists or antagonists of chemoreceptors, such as G protein coupled receptors involved in sensing of tastants, olfactants or pheromones. This is the amino acid sequence of a G protein alpha sub-unit q family (G alpha q) protein that can functionally coupled to sensory cell receptors such as taste GPCR's (G protein-coupled receptors) and olfactory GPCR's in an overly promiscuous manner.

                                                                                                                                                                                                                                                                                                                                                                                 component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, Alzheimer's disease, hyperparathyroidism, osteoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used:
(I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to G-protein fusion receptors (I) comprising: (I) in the N to C direction, extracellular (ECD), transmembrane (TMD) intracellular (ICD) domains, each chosen independently from a CAR (calcium receptor), GluR (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the linker. (I), and recombinant chimeric receptors (CR) without the GP

The invention comprises G-protein fusion receptors - comprising extracellular, transmembrane and intracellular domains similar to CaR, mGluR or GABAB receptor sequences. The G-protein fusion receptors of the invention may also possess a linker joined to the carboxy terminus of the intracellular domain, and a G-protein joined to the linker. The G-protein fusion receptors of the invention are useful for identifying modulators of CaR, mGluR and GABABR for use in treating associated conditions. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                              CC (1) in the N to C direction, extracellular (ECD), transmembrane (TMM) and CC intracellular (ICD) domains, each chosen independently from a CaR CC (calcium receptor), GluR (metabotropic glutamate receptor) and GABABR CC (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the CC linker. (I), and recombinant chimeric receptors (CR) without the GP CC component, are used to assess function of the various domains and to CC identify compounds (e.g. allosteric modulators or antagonists) that act CC identify compounds (e.g. allosteric modulators or antagonists) that act CC in these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or CC spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, CC Alpheimer's disease, hyperparathyroidism, osteoporosis, cognitive CC Alpheimer's disease, hyperparathyroidism, osteoporosis, cognitive CC disorders and depression. Nucleic acid (II) that encodes (I) is used: CC (1) for recombinant production of corresponding proteins; and (2) to CC produce cells used in screening for modulators. Use of CRR and mGluR CC domains allows presentation of GABABR domains, to a binding agent, in a CC domains allows presentation of shapar domains. By shuffling different CC domains, agents can be identified that affect particular domains of a receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (calcium receptor), Guna (metabotropic glutamate receptor) and GABABR (calcium receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the Component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, policepy, ischaemia, hypoglycaemia, anoxia, Alzheimer's disease, hyperparathyroidism, osteoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: domains allows presentation of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises G-protein fusion receptors · comprising extracellular, transmembrane and intracellular domains similar to CaR, mGluR or GABAB receptor sequences. The G-protein fusion receptors of the invention may also possess a linker joined to the carboxy terminus of the intracellular domain, and a G-protein joined to the linker. The G-protein fusion receptors of the invention are useful for identifying modulators of CaR, mGluR and GABABR for use in treating associated conditions. The present amino acid sequence was used in the production of the invention.

The modulators are potentially useful for treating or
                                                                                                                                                                                                                                                                                                    preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, Alzheimer's disease, hyperparathyroidism, elepoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: (1) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling differer domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially use e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  G-protein fusion receptor; CaR; calcium receptor; GluR; hea metabotropic glutamate receptor; GABABR; chimeric receptor; gamma-aminobutyric acid receptor; allosteric modulator; ant spinal cord injury; epilepsy; ischaemia; hypoglycaemia; ano Alzheimer's disease; hyperparathyroidism; osteoporosis; dep cognitive disorder.

                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                             present
                                                                                                                                                                                                                                                                                                                     intracellular domain, and a G-protein joined to the linker. The G-protein fusion receptors of the invention are useful for identifying modulators of CaR, mGluR and GABABR for use in treating associated conditions. The proceeds a single said GABABR for use in treating associated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel G-protein fusion receptor, CaR, mGluR and GABABR, comprises

                                                                                                                                                       extracellular, transmembrane and intracellular domains similar to CaR, mGluR or GABAB receptor sequences. The G-protein fusion receptors of the invention may also possess a linker joined to the carboxy terminus of the intracellular domain, and a G-protein joined to the linker. The G-protein fusion receptors of the invention are useful for identifying modulators of CaR, mGluR and GABABR for use in treating associated conditions. The present amino acid sequence was used in the production of the invention.
                                                                                                                                                                                                                                                                             Disclosure; Fig 16; 168pp; English.
                                                                                                                                                                                                                                                                                                             Novel G-protein fusion receptor, useful for identifying m CaR, mGluR and GABABB, comprises G-protein joined to the demain of the receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chimeric -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AA015102
                                                                        invention may also possess a linker joined to the carboxy terminus of the intracellular domain, and a G-protein joined to the linker. The G-protein fusion receptors of the invention are useful for identifying modulators of CaR, mclur and GABABR for use in treating associated conditions. The present amino acid sequence was used in the production of the invention.
                                                                                                                                            The invention comprises G-protein fusion receptors - comprising extracellular, transmembrane and intracellular domains similar to CaimGluR or GABAB receptor sequences. The G-protein fusion receptors of
